

BRAIN DONATION FOR SCIENTIFIC RESEARCH

Brain donation plays a crucial role in advancing research on various movement disorders, including research into new treatments. When someone donates their brain, it's used for scientific purposes.

A single donated brain can yield tissue for hundreds of research studies, which makes brain donation a valuable gift for researchers and future generations.

If you are a patient of the Movement Disorder Clinic and you are interested in learning more about brain donation you can talk to your movement disorder specialist at your next appointment for more information.

You can also contact the Clinic Resource Nurse at [204-940-8427](tel:204-940-8427) to inquire about brain donation.
